Goals and challenges during booking processes in general

Goals of booking process

- Fast and frictionless flow: A streamlined experience that minimizes steps and reduces friction.
- Clear details and expectations: All relevant info—pricing, availability, and terms—is easy to find and understand.
- Inclusive and accessible design: Works seamlessly across devices and accommodates different user needs.
- Instant confirmation with reassurance: Users receive prompt and reliable feedback that their booking is complete.
- Options to personalize the experience: Allows users to adjust timing, preferences, or extras to suit their needs.

Challenges during booking

- Enhance website/platform usability: Make the booking experience smooth and accessible by ensuring the platform is mobile-friendly, responsive, and easy to navigate.
- Simplify Navigation: Design an intuitive interface with easy-to-follow steps, reducing confusion and making the booking process more efficient.
- Technical issues or system errors: Glitches, slow loading, or broken features can interrupt the process and lead to user drop-off.
- Offer advanced filtering options: Enable users to quickly refine search results using multiple criteria to simplify decision-making and improve booking accuracy.

Research questions

The goal is to understand how a green-themed design influences users' willingness to choose carbon offsetting, and if eco-friendly visuals motivate more sustainable decisions. It also examines effective ways to integrate Atmosfair content into the booking process while maintaining a smooth user experience. Finally, it investigates how likely users are to offset CO2 when the option appears during passenger details, focusing on whether timing and placement impact their choices.

How does a green-themed design influence users' willingness to choose carbon offsetting?

How can Atmosfair content be integrated into the booking process?

How likely are users to offset CO2 when shown during passenger details?

Our design process

These pages outline a **UX/UI usability testing plan for the Atmosfair flight booking system**. It focuses on tracking user behavior and interface clarity across key steps of the booking process.

Goals / KPIs (Key Performance Indicators)

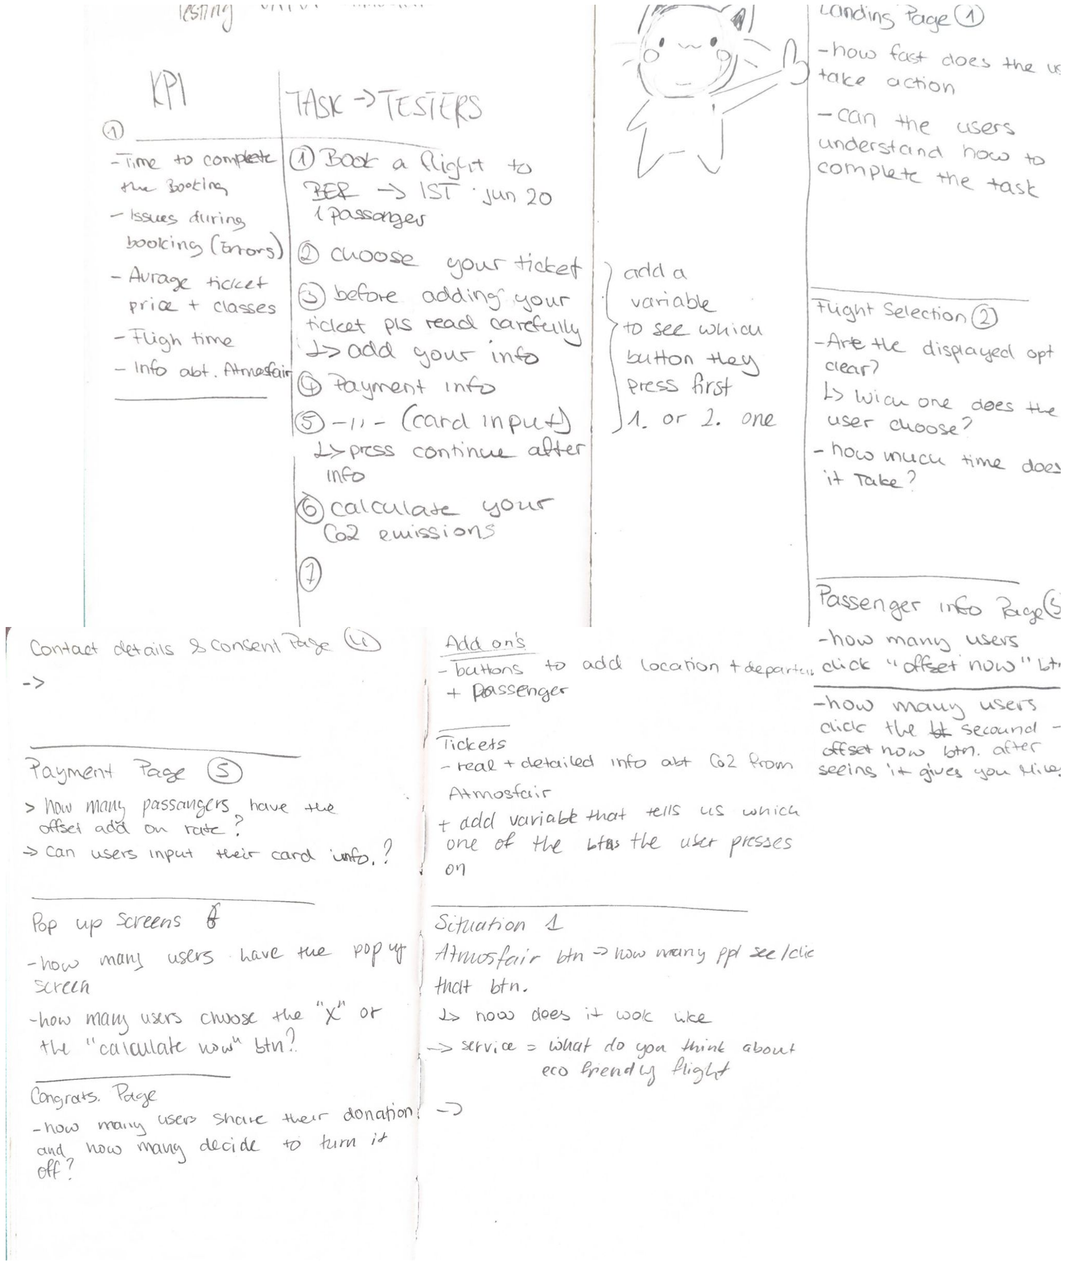

Time to complete booking
Errors or issues during booking
Whether users understand Atmosfair's role

Test Tasks for Users:

1. Book a flight (e.g. BER → IST)
2. Choose a ticket
3. Enter passenger info
4. Observe behaviour on pop-ups, offset donation options, and final screens

Behavioral Tracking:

- Which buttons are clicked first
- Time to action on landing page
- Which offset options users select
- How users interact with pop-ups
- Whether users share donations or exit

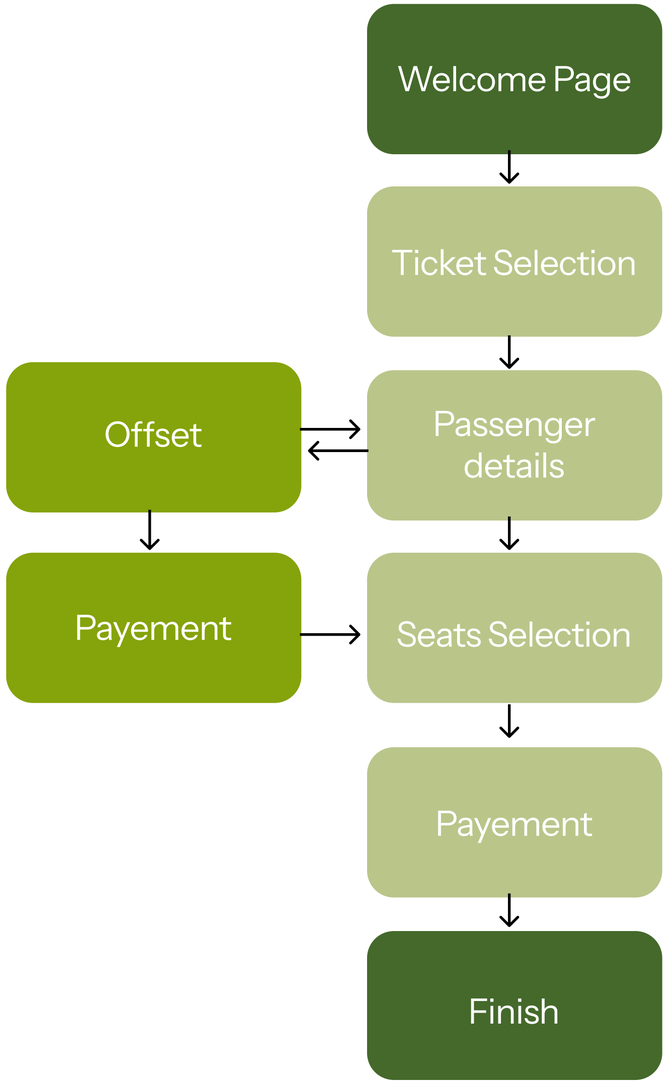

Information architecture

Of test scenario 1

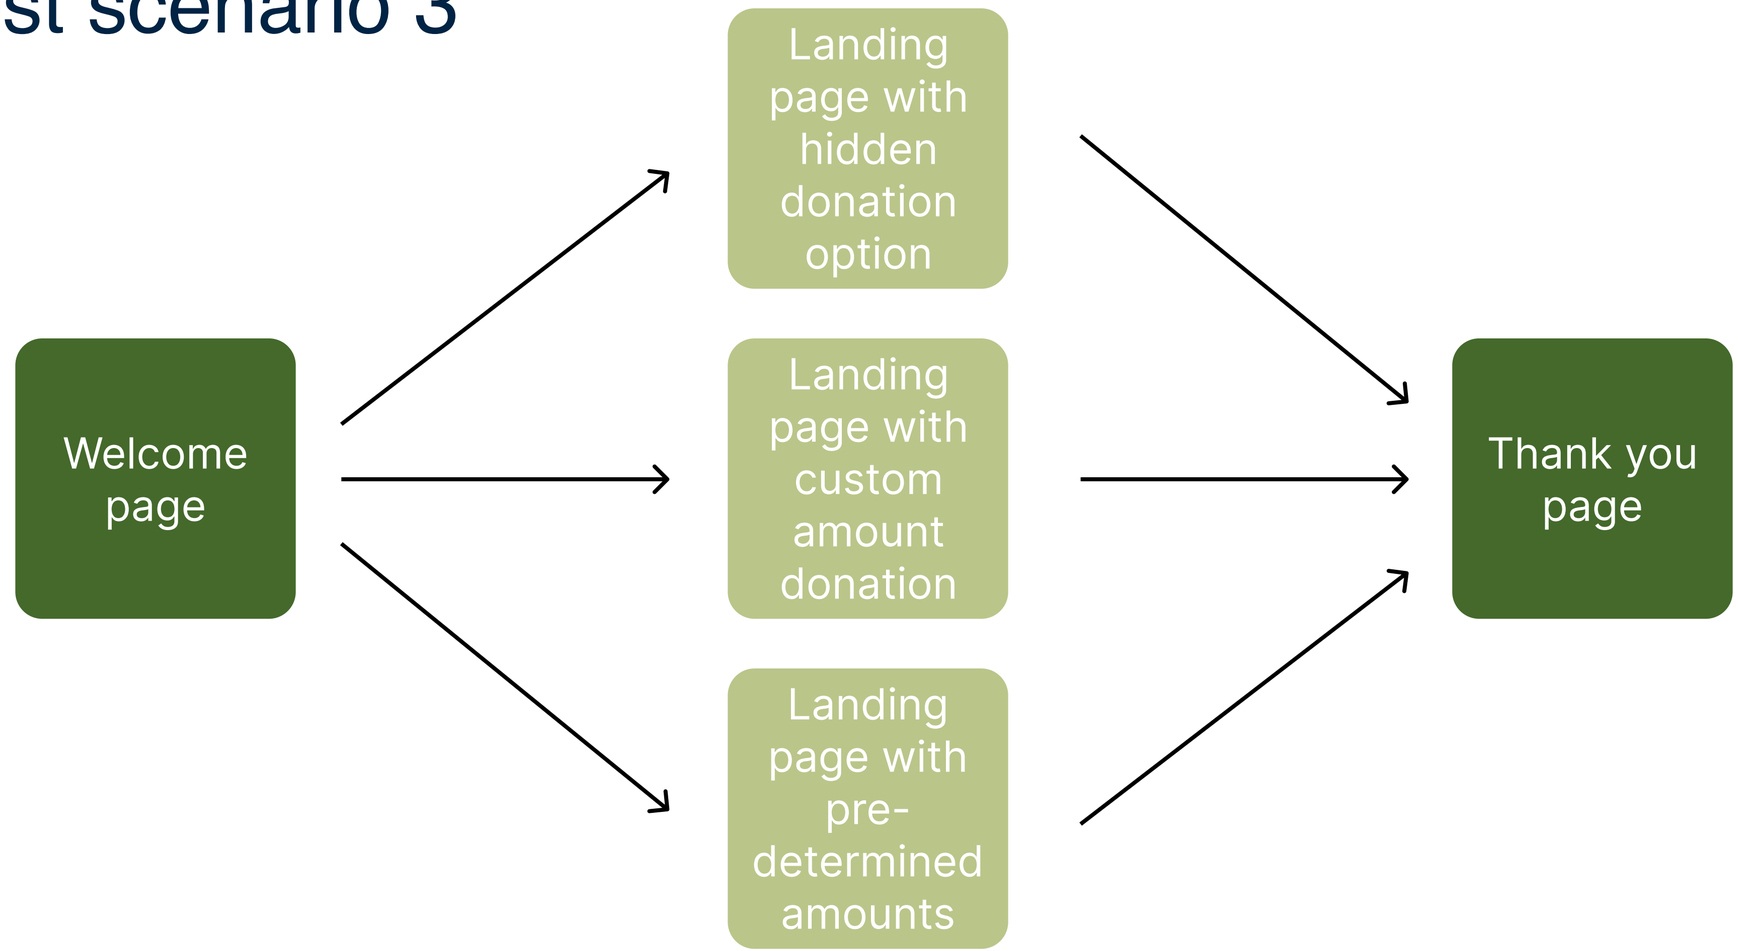

This user testing aims to explore how users interact with an environmentally focused offset option introduced during the flight booking process.

- Participants begin at the Welcome Page, moving through Ticket Selection, Passenger Details, Seat Selection, and finally Payment before finishing the booking.
- A special focus is placed on the Atmosfair offset feature, which appears during the booking flow. Users are shown a banner or link encouraging them to offset the environmental impact of their flight.
- Button interaction reflects how many users clicked the Atmosfair element—showing initial interest in the offset process.
- Continuation behavior shows whether users decided to follow through with offsetting (Yes) or chose to return to the regular booking process (No).

Information archutecture

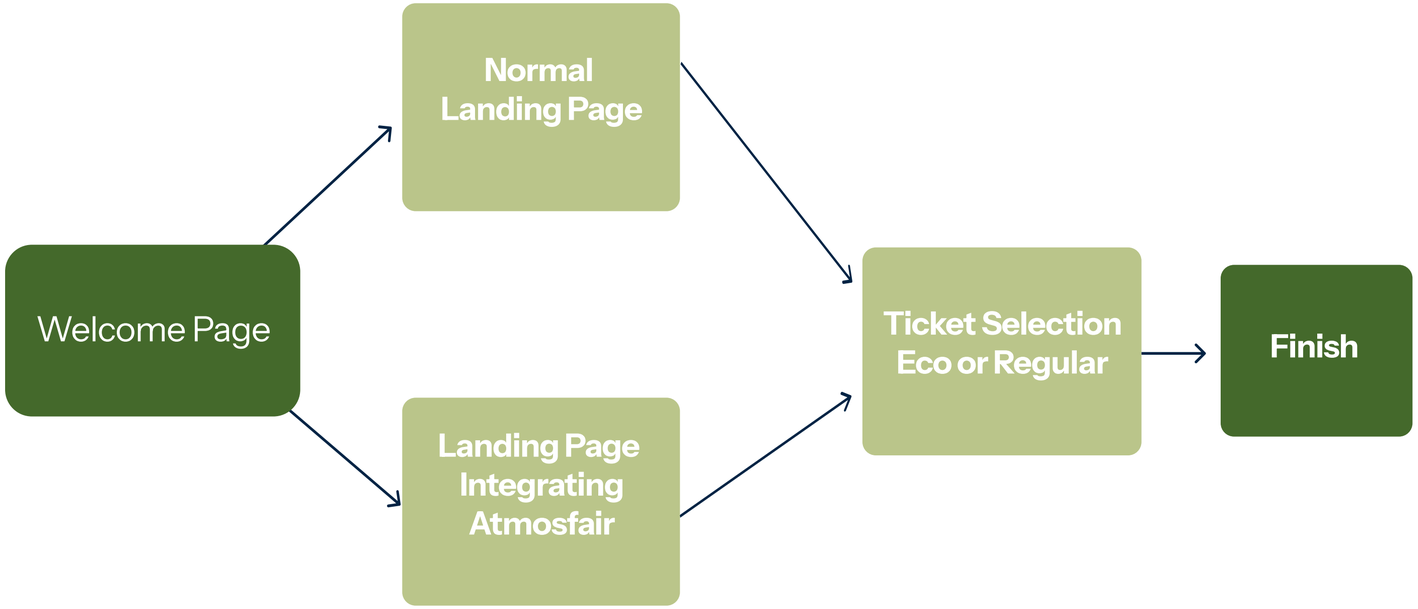

Of test scenario 3

Information architecture
Of test scenario 2

This user testing aimed to explore how emotional connection influences user behavior.

Participants were randomly shown one of two landing pages: the standard Turkish Airlines page or a modified version featuring Atmosfair, with a bold hero section promoting carbon offsetting and green travel.
After viewing the landing page, all users were directed to a ticket selection step where they had to choose between the "Eco Fly" option powered by Atmosfair or the standard Turkish Airlines fare. The goal was to analyze how emotionally-driven content impacts the choice of sustainable travel options.

Test 2
Overview

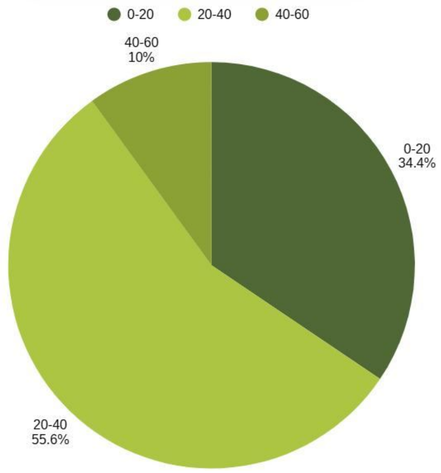

This user testing involved **90 participants** assigned to either Random Page 1 (**Normal Landing Page**) or Random Page 2 (**Integrating Atmosfair into the Landing Page**).

- Most users were in the 20–40 age range, followed by 0–20 and 40–60.
- Gender distribution was **53.33% female**, **45.56% male, and 1.11% other**.
- Participants interacted with "Eco" and "Normal" buttons, depending on their assigned page. **On Page 1, "Normal" was pressed slightly more**, while **Page 2 had more "Eco" clicks**.

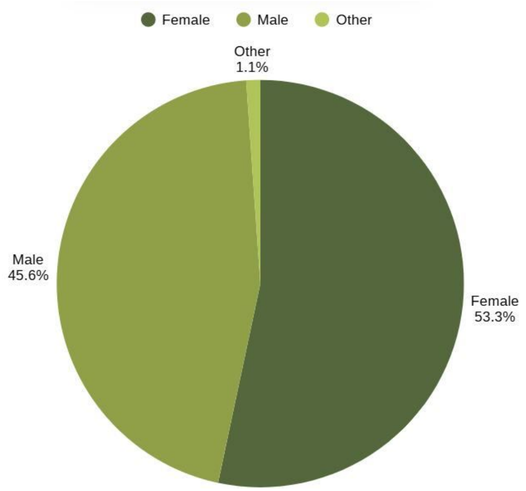

This test provides valuable insights into user behavior and preferences based on interaction with eco-friendly options.

Google Spreadsheet

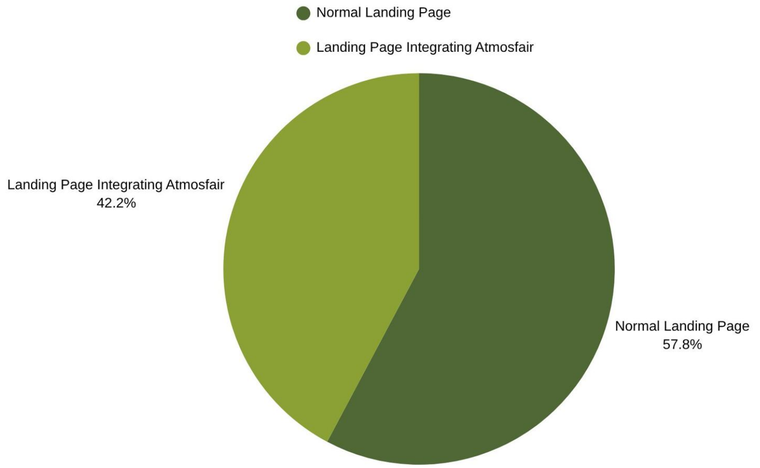

Number of users by Age

Number of users by gender

Number of users assigned to random pages

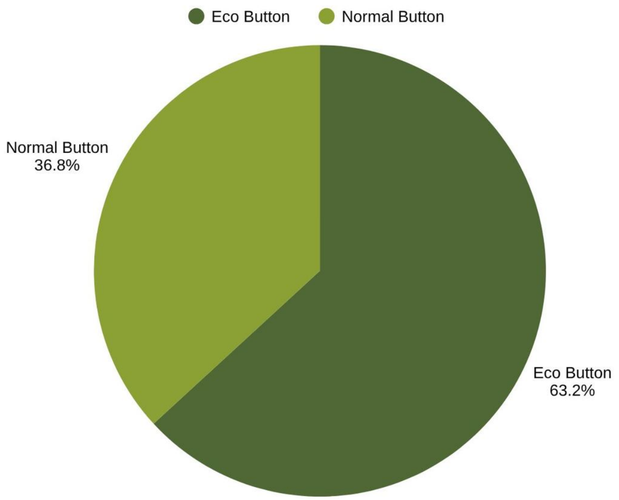

Test 2
Overview

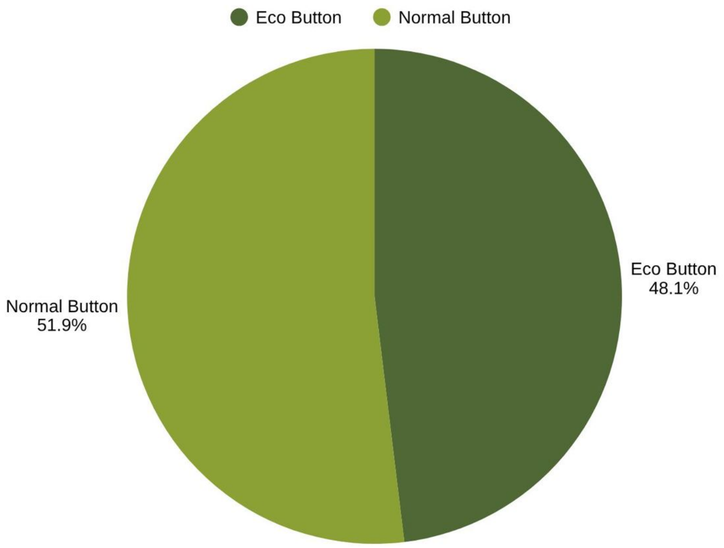

This user testing showed that **integrating emotional, sustainability-focused content** (via Atmosfair) on the landing page significantly **increased the selection of the "Eco" option (63.2%)** compared to the standard page (48.1%). This suggests that **emotional messaging positively influences eco-friendly behavior.** Most participants were aged **20–40, a demographic more inclined toward sustainability**, and gender distribution was balanced.

The test confirms that how options are presented—especially with values like green travel—can strongly shape user decisions.

Integrating Atmosfair Content into Booking Process
28.07.2025

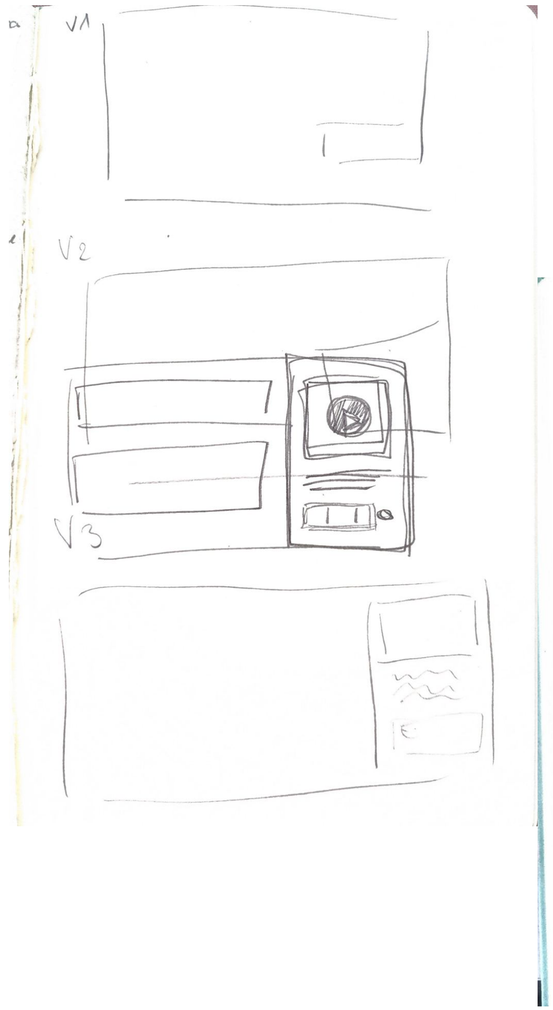

Our design process

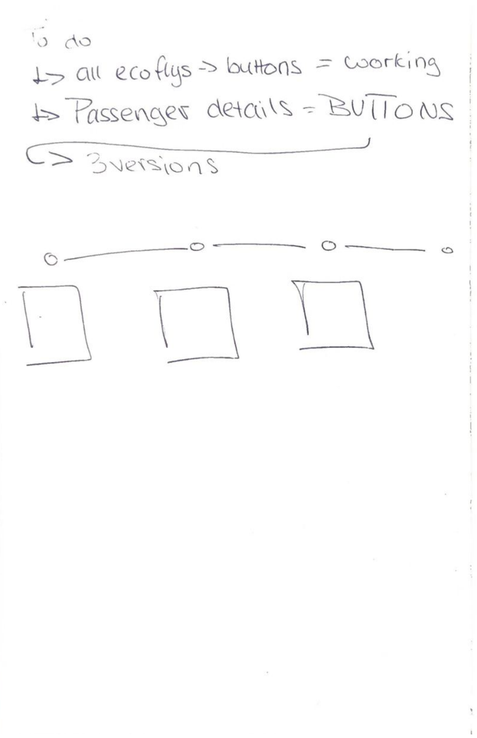

A structured **usability testing flow** and maps the entire booking journey on the Turkish Airlines platform.
The process is built to test both **interface clarity** and **user interaction behaviour**.

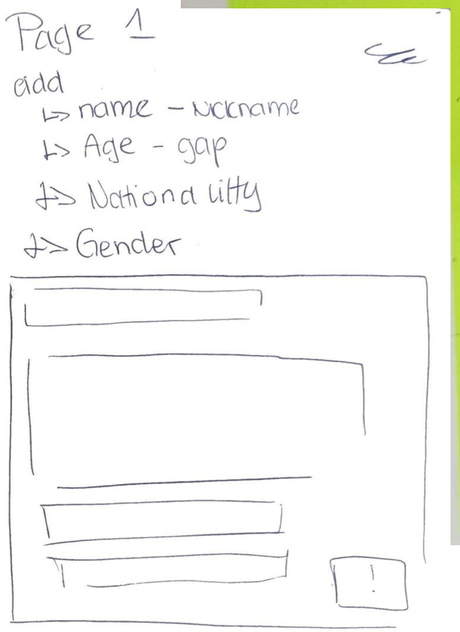

1. Landing Page
2. Flight Selection Page
3. Passenger Info Page
4. Payment Info Page
5. CO_2 Emission Calculator
6. Contact & Consent Page
7. Confirmation (Congrats) Page

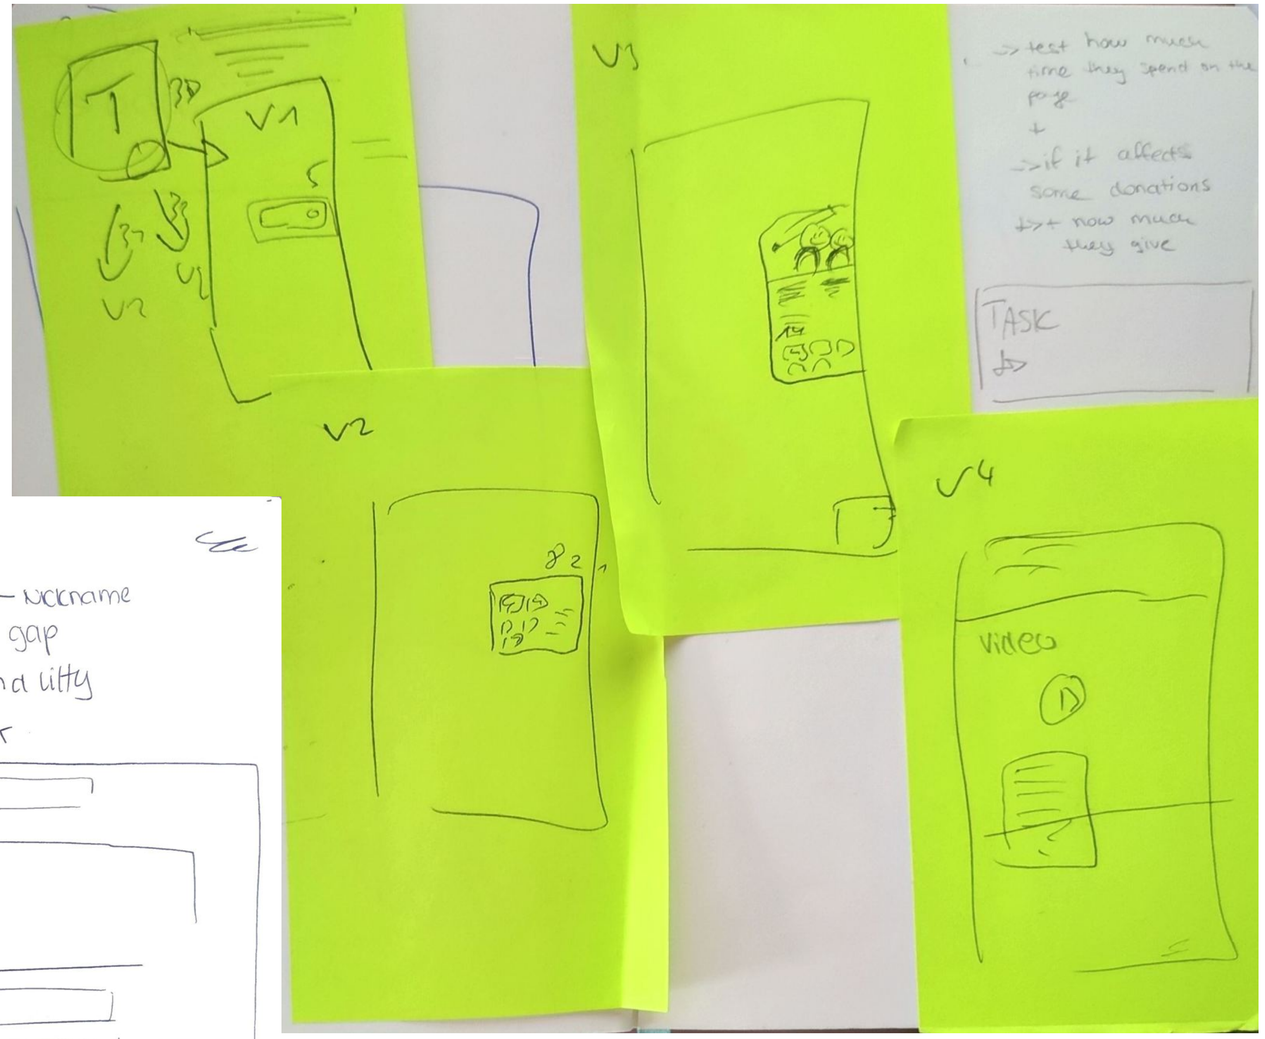

Our design process

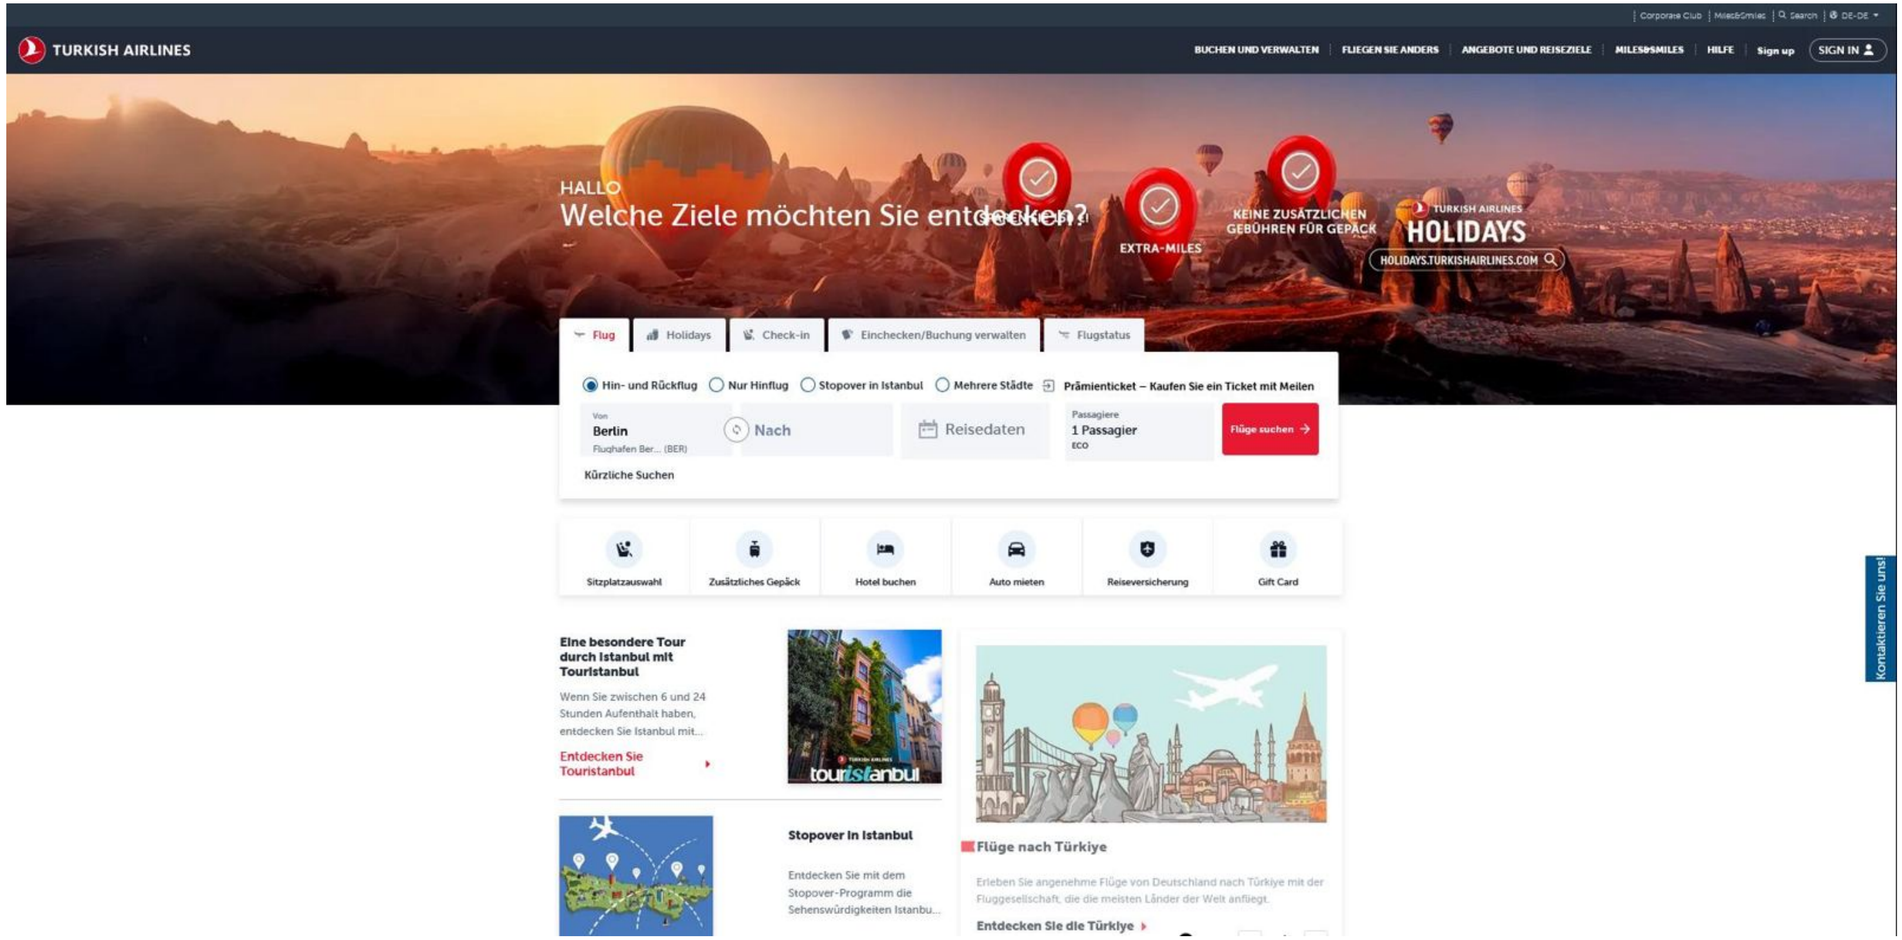

Turkish Airlines

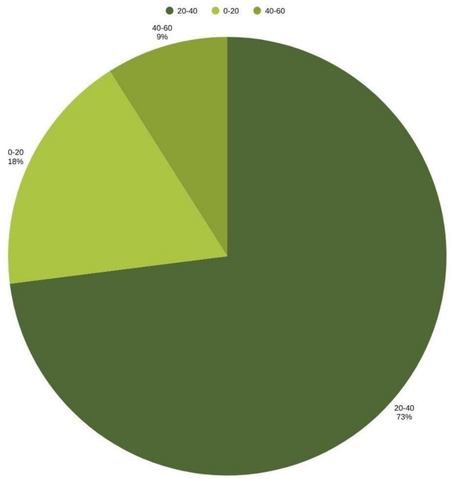

Scenario 3
Overview

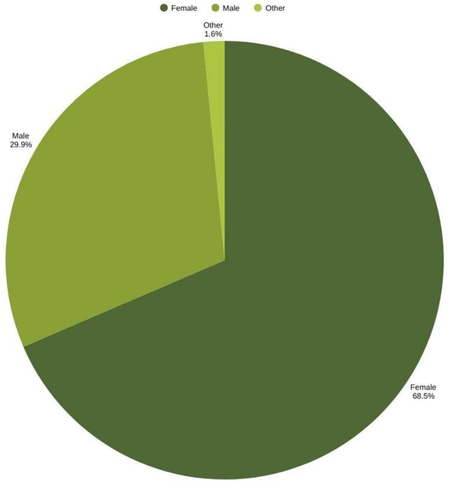

This user testing involved **57 participants** assigned to the 3 randomized pages overall. Most users were in the 20–40 age range.
Gender distribution was **68.54% female**, **29.9% male, and 1.56% other**.
Participants had the option to **donate at the checkout page** if they wanted to. Data shows that they were more likely to donate if the **donation amount was predetermined**.

This test provides valuable insights into user behavior and preferences based on interaction with different designs.

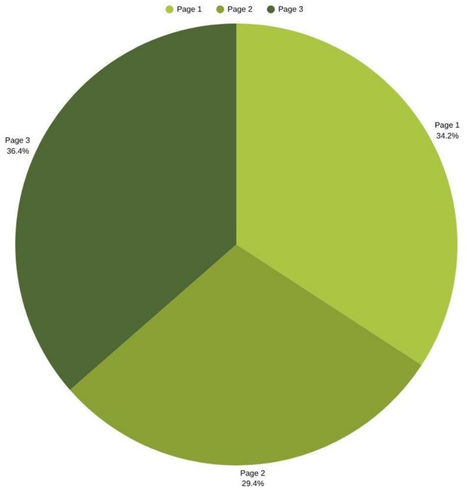

Number of users by Age

Number of users by gender

Number of users assigned to random pages

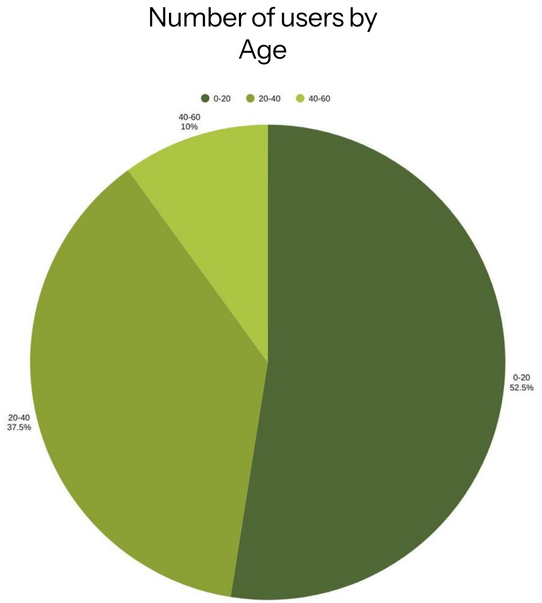

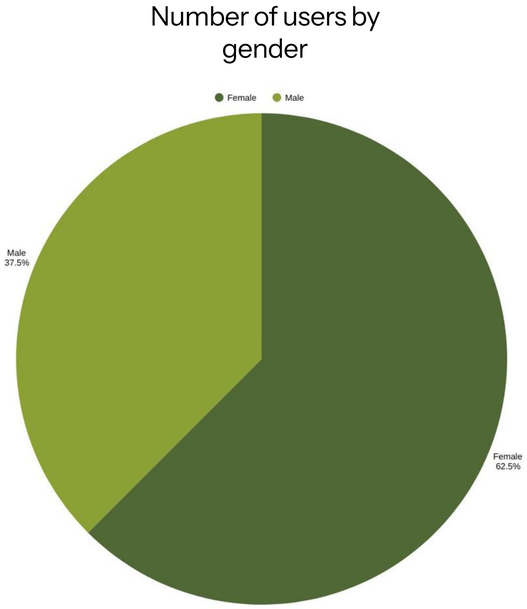

Test 1
Overview

This focused user testing analyzes a selected group of 40 participants who interacted with the Atmosfair offset integration.

- The age breakdown shows most users were in the 0–20 age group (52.5%), followed by those aged 20–40 (37.5%), and a smaller portion in 40–60 (10%).
- Gender distribution leaned toward female users, with 62.5% female and 37.5% male representation.

spreadsheets link

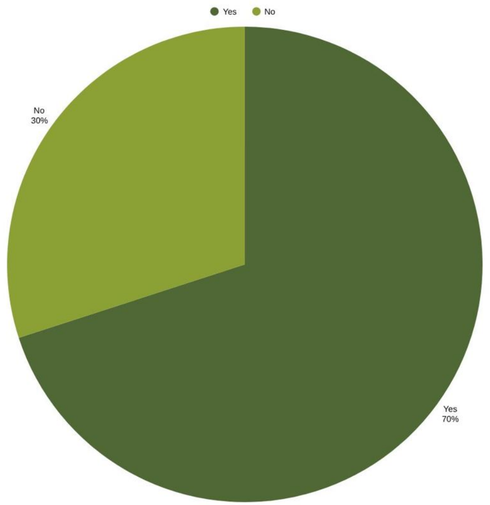

Test 1
Overview

- When it came to engaging with the Atmosfair banner or offset option, 70% of participants clicked to explore the offset process, indicating a strong initial interest in understanding sustainability options.

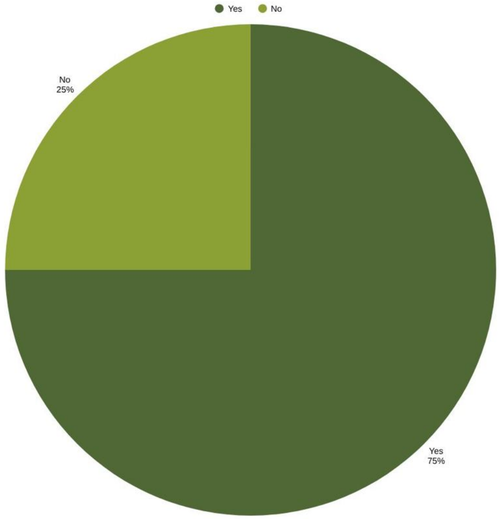

- Among those who opened the offset page, 75% continued with the offset process, while 25% opted to return to the standard booking flow. This continuation metric reflects meaningful engagement beyond curiosity, suggesting the offset feature resonated with users enough to influence their booking behavior.

These findings highlight that both the click-through rate and follow-through behavior tied to Atmosfair are key indicators of impact. Younger users and female participants showed higher engagement, and the high continuation rate suggests that emotionally framed sustainability messaging successfully encourages eco-conscious decision-making.

Did users Clicked offset now Button?

Did users continued the offseting process?

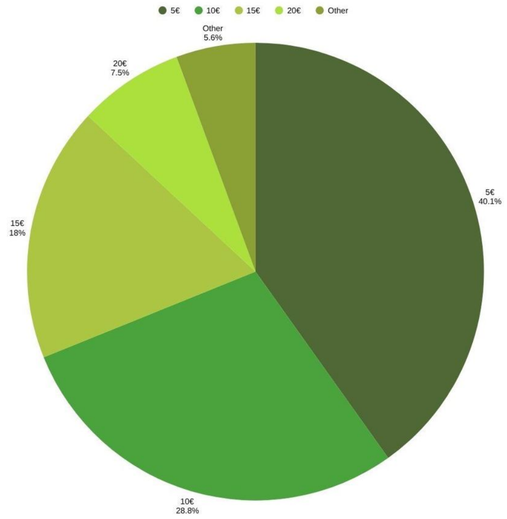

Scenario 3
Overview

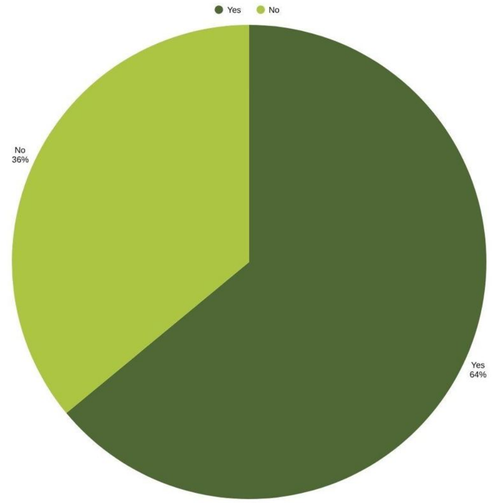

This user testing showed that **64% of participants were willing to donate** overall. The **smaller donation amounts** seemed to be more popular for most people.
If we look at each checkout page design separately, we can clearly see that the **more noticeable** the design, the **more willing** people are to donate. The **predetermined donation amounts** were probably more inviting also.

The test confirms that how options are presented can strongly shape user decisions.

Test Concept

Results
Learnings

Most Successful Test: Test 3 – Checkout Integration with Predetermined Donations

Highest Conversion into Action:

- Participants chose to donate — the highest direct behavioural commitment across all tests.
- This shows not just interest or exploration, but actual monetary follow-through.

Smart Design Drives Behavior:

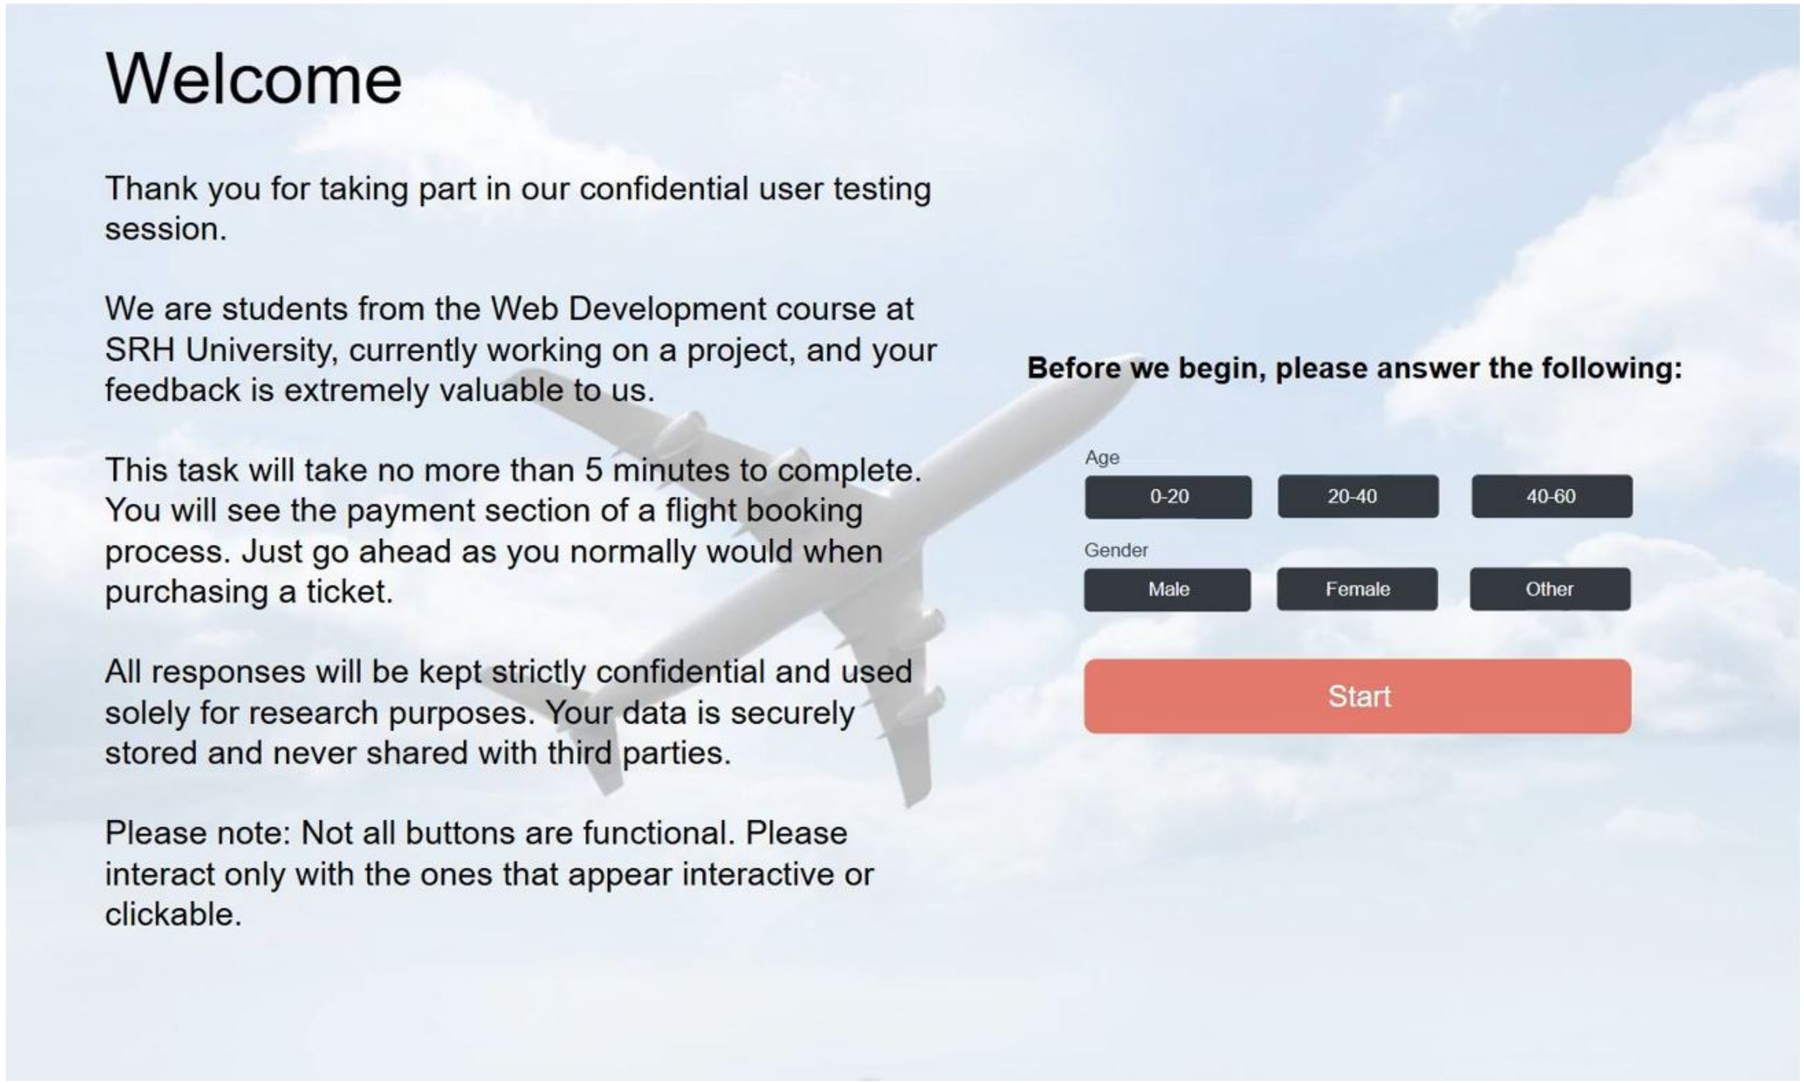

- Participants were more likely to donate when donation amounts were predetermined, reducing friction and decision fatigue.
- More visible and well-designed donation elements led to higher engagement.

Placement at a Critical Decision Point:

- By integrating Atmosfair at checkout, Test 3 positioned sustainability as a final, values-driven action—a strong behavioral trigger.
- This placement ensures users act at the moment they're already making a financial commitment, reinforcing eco-conscious behavior.
